

## SEAD Backend Problem Report

- Classifier doesn't work with device categories not already in the classifier
- API sometimes works and lacks features
- Landing zone usually works, but may not store valid data

The classifier has not been integrated into API, so it is not possible to get a classification from the API or to give the API a manual classification.

The subset option in the API contains bugs and does not always work to specification. In particular, it often returns fewer data points than it should.

The classifier is not able to reliably classify microwaves.
